*Passionate about innovative bird proofing solutions*

With the assistance of the talented web team at Ralenti, we are pleased to introduce our new Ace Birdproofing Systems website.

This site has been re-designed with your needs in mind. Especially our 'how it's done' approach. This was achieved with the aid of 'before and after' examples of real New Zealand bird proofing situations which we have helped to provide solutions for. All main product groups are covered.

We added in a few examples of what can go wrong when installers lack real bird proofing knowledge. You will see the added benefits available when working with the professional Ace Birdproofing team.

Since our last Newsletter we have successfully tackled many interesting bird proofing projects. These frequently started through working with architectural and engineering practices during the building design stages.

<h3>Urban Birdproofing Solutions</h3> <h4>Case Study — National Distribution Centre</h4> <p>This project involved the total renovation a large, but older warehouse and office facility. The most significant addition from a bird proofing viewpoint was the new canopy. The canopy rates as one of the largest single span canopies, being at 68M span and 90M length.</p> <p><b>The Brief:</b> The tender brief called for installing 19mm knotted polyethylene BirdNet under the trusses of the canopy structure complete with proprietary fittings. The object was to prevent birds gaining entry from the underside of the net into the canopy roof void. Our discussions with the contractor verified their exact requirements and the additional features available, including fitting Zips.</p> <p><b>The Solution:</b> The Ace BirdNet installation was staged to fit in with work by other trades in surrounding areas under construction. Ten separate nets were fitted under the trusses to form a single layer of tensioned horizontal Ace BirdNet.</p> <p>Later a variation was issued to install a 90M x 4.5M net vertically down the inside of the outer canopy wall, stopping 1.4M above the floor.</p>						<p>Review bird problems and their solutions</p> <p>Poor Proofing Examples</p> <p>Good Proofing Examples</p>

<p>The Total Renovation of a large, but older warehouse</p>						

Two recent projects which illustrate the value of this partnership are:

- the Blue Water Black Magic (Auckland Maritime Museum) and,
- the Aotea and Bledisloe canopy proofing in the Aotea Precinct project.

Both of these are featured under the 'Hot Wire' icon at <http://www.birdproofing.co.nz/hotwire.php#photos>

The Aotea Precinct project is believed to be the largest electrified bird repellent installation to date in Australasia.

Other web innovations are the educative 'Why Control Birds', and the 'Case Studies' sections. These are highly illustrated, but accessed without the delays found in many other websites. It is a case of 'seeing is believing'. Real NZ examples of proofing problems and solutions.

Ace are not about gadgets and gimmicks. You won't see us advertising models of birds of prey, CO2 cannons, ultra-sonic sound emitters, sticky bird gels or balloons with faces on, or similar gimmicks.

Our emphasis is on sound, well researched and proven bird products, installed in the correct manner. We will listen, discuss and advise on any of your projects, or if you prefer – will work directly with your clients, property or project managers, building owners & building contractors etc.

Ace are first and foremost Bird Proofing Installers - mainly installing in the BOP, Waikato & Auckland regions. For projects elsewhere, there are a number of trained bird proofing installers we work closely with. We also retail our main DIY products - Ace Bird Brush and Ace Bird Spikes.

We would appreciate this Newsletter being circulated within your Team so they too can benefit from the latest in Bird Proofing solutions when working on commercial, industrial and infrastructure projects.

Allan Riley,  
Director.
